## Falk Quadrive Basic Information

**Factory Warranty** — We're so confident in the performance and reliability of our latest generation of Falk gear drives that we're backing this comprehensive offering with the best standard warranty in the business. Our full, three-year heavy-duty warranty provides shaft-to-shaft protection on all Falk components – including bearings and seals (warranty extends for three years from date of shipment). It's an industry first and one more powerful reason why Falk is your ultimate bottom-line value.

See Extended Warranty statement (100-003) on our website: [www.rexnord.com/terms](http://www.rexnord.com/terms)

### Safety Notes

**Falk Gear Drives** — The Falk and Rexnord® name on the gear drive is the purchaser's assurance that the drive was engineered, rated and manufactured to sound design practices.

When one prime mover drives two pieces of equipment, one of which is either a standard Falk geared drive or a customer standard geared drive, the division of power between each machine is the responsibility of the customer. The power supplied to the geared drive must be equal to or less than the power for which the drive was selected using the appropriate service factor for the application. The customer must also assume the responsibility of isolating the geared drive from any vibratory or transient load induced by the driven equipment.

Install and operate Rexnord products in conformance with applicable local and national safety codes and per Rexnord owner's manual which is available upon request. Suitable guards for rotating members may be purchased from Rexnord as optional accessories. Consult your local Rexnord Account Executive for complete details.

**People Conveying Equipment** — Selection of Rexnord gear drives for applications whose primary purpose is the transportation of people is not approved. This includes such applications as freight or passenger elevators, escalators, man lifts, work lift platforms and ski tows and ski lifts.

If the primary purpose of the application is material conveyance and occasionally people are transported, the Rexnord warranty may remain in effect, provided the design load conditions are not exceeded and certification to the appropriate safety codes and load conditions has been obtained by the system designer or end user from the appropriate enforcement authorities.

### Gear Drive Ratings

Shaft-Mounted, Flange-Mounted and Screw Conveyor Drives are rated to a specific application by the use of Load Classifications. Each application has its own conditions and operating requirements. These have been analyzed and cataloged into three load classifications ... uniform, moderate shock and heavy shock. Load classifications, based on field experience, have been assigned to these applications for service of 3 to 10 hours per day, and for service over 10 hours per day, and also for the type of prime mover. Values for most applications are listed on page 8. Refer unlisted applications to Factory.

Load Classifications are based on the assumption that the system is free of dynamic vibrations, as explained in the warranty section. Refer applications subject to repetitive shocks and applications where exceedingly high-energy load must be absorbed, as when stalling, to Factory for special consideration.

**Operating Temperature** — Gear drives can encounter sump oil temperatures up to 200°F (93°C). Higher temperatures are possible in localized areas. Since the drive will feel hot to the human hand at temperatures over 120°F (49°C), a portable pyrometer should be used to measure temperatures. Some drives, as indicated in the selection tables, are furnished with fans to ensure satisfactory operating temperatures.

**Conditions Affecting Gear Drive Selection and Application** — The following conditions may affect the drive selection procedure, drive size and auxiliary equipment being furnished. Refer to page 5 for more information.

- Excessive overloads
- Reversing service
- Brake-equipped applications
- Oversized prime movers
- Multi-speed or variable speed applications
- Excessive ambient temperatures
- Excessive overhung loads or thrust loads
- Product modification
- Non-standard mounting positions
- Backstops

**Stored & Inactive Drives** — Each gear drive is spin-tested with a rust-preventive oil that will protect parts against rust for a period of four months in an outdoor shelter or twelve months in dry building after shipment from Rexnord.

Periodically inspect stored or inactive drives and spray or add rust inhibitor every six months or more often, if necessary. Indoor dry storage is recommended.

Drives ordered for extended storage can be treated at the Factory with a special preservative and sealed to rustproof parts for periods longer than those cited above, if specified on the order.

Refer to the appropriate service manual for extended storage of gear drives which have been in service.

---

## Conditions Affecting Selection

### Non-Standard Application Procedures

The following conditions may affect the drive selection procedure, drive size and auxiliary equipment being furnished.

**Excessive Overloads** — The maximum momentary or starting load must not exceed 200% of rated load (100% overload). Gear drive selections allow the following minimum momentary overloads for electric motor applications:

Class I Selections: 100% overload, or 200% of nominal motor rating.

Class II Selections: 180% overload, or 280% of nominal motor rating.

Class III Selections: 300% overload, or 400% of nominal motor rating.

If the maximum starting or momentary load exceeds the above conditions, refer to Factory.

**Reversing Service** — Applications involving either more than 20 reversals per 10 hour period, or less than 20 reversals per 10 hour period with peak torques greater than 200% of normal load must be referred to Factory.

**Brake-Equipped Applications** — When a gear drive is equipped with a “working” brake that is used to decelerate the motion of the system and the brake is located between the prime mover and the gear drive, select the drive based on the brake rating or the highest equivalent power rating, whichever is greater. If the brake is used for holding only and is applied after the motion of the system has come to rest, the brake rating must be less than 200% of the catalog rating of the gear drive selected for the application. If the brake rating is greater than 200% of the gear drive catalog rating, refer the application to the Factory. Also refer to Factory all applications in which the brake is located on the output shaft of the gear drive.

**Oversize Prime Movers** — Published Service Factors do not cover applications that require oversize prime movers for high energy or peak loads. Refer such applications to the Factory for selection of suitable drives.

**Speed Variation** — When selecting gear drives for multi-speed or variable speed applications, determine the speed which develops the greatest torque and select the gear drives on this basis. If the speed is not listed in the selection table, use the next lower output speed.

Refer all variable and multi-speed applications to the Factory. They may require special consideration to provide adequate lubrication at the slowest speed, but without excessive heating or churning at the highest speed. It is essential that all orders indicate minimum and maximum speeds, as well as the speed duration cycles.

**Effects of Solar Energy** — If a drive operates in the sun at ambient temperatures over 100°F (38°C), then special measures must be taken to protect the drive from solar energy. This protection can consist of a canopy over the drive or reflective paint on the drive. If neither is possible, additional cooling may be required to prevent the sump temperature from exceeding the allowable maximum of 200°F (93°C).

**Overhung Loads and Thrust Loads** — The overhung load and thrust ratings published in this selection guide are based on a service factor of unity and a combination of the most unfavorable conditions of rotation, speed, direction of applied load and drive loading. If the calculated load exceeds the published value, or if an overhung load and thrust load are applied simultaneously to a shaft, refer complete application details to the Factory. For more information refer to tables and guidelines on pages 16 and 17.

**Product Modifications** — Rexnord can supply special product modifications to suit your application needs. Contact your local Rexnord Account Executive for housing modifications, special ratios, special shafts, special mounting conditions, accessory modifications and other special application requirements.

**Mounting Positions** — All drives must be mounted within the limits specified on the dimension pages unless specifically ordered otherwise. Unless Factory approved, other mounting positions may lower the oil to a level that will starve gears and bearings; overfilling a drive with oil may cause leakage through the air vent, foaming and churning and consequently, overheating. Either condition can result in damage to gears and bearings.

**Backstops** — Backstops provide positive prevention of reverse rotation or backrun without backlash on conveyors, elevator head shafts and similar applications. Designed as standard accessories, backstops can be furnished on horizontal drives. Do not use backstops on vertical drives.

DO NOT use the backstop as a substitute for a brake.

These backstops are designed to prevent reverse rotation five times or less in eight hours, with one minute or more in the overrunning direction between backstopping load applications. If backstopping operations are more frequent, or the time between operations is less than one minute, the backstop is classified as a working or indexing device and the application must be referred to the Factory for engineering review.

When ordering a drive equipped with a backstop, specify whether the Falk hollow shaft is to rotate clockwise or counterclockwise when facing the input side of the gear drive.

## How to Select

### 1. Information required.

- Driven machine
- Motor horsepower/rpm/frame size
- Hours/day operation
- Driven shaft diameter/rpm
- Mounting requirements/space limits

If you have an unusual application involving any of the following conditions, refer to page 5.

- Excessive overloads
- Reversing service
- Brake-equipped applications
- Oversized prime movers
- Multi-speed or variable speed applications
- Excessive ambient temperatures
- Excessive overhung loads or thrust loads
- Product modifications
- Non-standard mounting positions

### 2. Drive selection.

Determine load classification based on the application from Table 1, page 8. Refer to Class I, II or III Selection Tables on pages 9-14. Select basic gear drive size and ratio opposite desired horsepower and output speed (note the minimum high-speed shaft sheave pitch diameter). Determine drive Type JR (Shaft-Mounted Drive), JF (Flange-Mounted Drive) or JSC (Screw Conveyor Drive). Also check the overhung load and thrust load. Thermal capacities in selection tables are based on 80°F (27°C) ambient. If ambient temperature exceeds this value, refer to Factory.

The selection tables show the most economical drive ratio for a given speed.

### 3. Check dimensions.

Refer to drive size dimension pages and check TA taper bushing bore, mounting position, clearances, and motor mount and motor frame size details.

### 4. Sheave ratios.

Nominal sheave ratios are given in Table 10, on page 44. Select final V-belt to suit the motor mount center distance and compare the driven sheave pitch diameter to the minimum determined in the selection table.

## Example

### 1. Application details:

Uniformly-loaded inclined belt conveyor.

20 Horsepower, 1750 rpm motor, 256 T frame.

10 Hours/day operation.

2-11/16" Diameter head shaft at 44 rpm.

Shaft-mounted drive/horizontal.

### 2. The load classification from Table 1, on page 8, is Class I. From the Class I selection, Table 2, on page 9, opposite 20 hp and output range of 28-53 rpm, the drive size is 5215J\_25 with a minimum H.S. sheave pitch diameter of 4.4". Drive type is a "JR" shaft-mounted drive.

### 3. Refer to pages 26 and 27 to check drive dimension data. A hollow shaft Bushing No. BU5215J-2.688, Part No. 0769143 is required to fit the drive to the 2-11/16" diameter headshaft. A 6-o'clock mounting position is required. The motor mount center distance range available is 24.8-37.2", with a 256T frame motor.

### 4. From Table 10, on page 44, the nominal sheave ratio is 1.59 for a 25:1 ratio drive with a 1750 rpm motor, at 44 rpm output. Select the V-belt drive to suit the available center distance range (short, medium or long). Be sure to allow for belt take up. Also, verify that the driven sheave pitch diameter is larger than the minimum specified.

## Order:

Basic Drive 5215JR25 PN 0794385

Bushing BU5215J-2.688 PN 0769143

Torque Arm TA52157J PN 0785267

① **Load Classifications for Engine-Driven Applications** — Multi-Cylinder Engines: Use the next higher Service Class than the one given in Table 1 for the same application when motor-driven. (Example: A motor-driven, uniformly-loaded belt conveyor for 10-hour service is Class I; the same conveyor driven by a multi-cylinder engine would be Class II). For applications which require Class III when motor-driven, refer to Factory for recommendations on engine drives. Single Cylinder Engines: Refer to Factory.

② Selection of Falk products for applications whose primary purpose is the transportation of people is not approved. This includes such applications as freight or passenger elevators, escalators, man lifts, forklift platforms, ski tows, and ski lifts. If the primary purpose of the application is material conveyance and occasionally people are transported, the warranty may remain in effect, provided the design load conditions are not exceeded and certification to the appropriate safety codes and load conditions has been obtained by the system designer or end user from the appropriate enforcement authorities.

① **Horizontal Drives** – Refer to Engineering 377-114 for maximum output speeds. **Vertical Drives** – Make selection from Table 2, Table 3 or Table 4 and then refer to Engineering 377-114 to determine drive speed limits with and without cooling.

② Values are for V-belt drives and load applied one shaft diameter from seal cage or fan if so equipped. For minimum sheave diameters for other axial locations, refer to load location factor table on page 16. Multiply values by 0.66 when using timing belt or chain drives.

③ Minimum sheave PD is maximum for speed range. Consult Rexnord factory for lower values.

## Class II

### Quick Selections for <sup>®</sup> Shaft (JR) and Flange (JF) Mounted Drives — Sizes 5107 thru 5608, Screw Conveyor (JSC) Drives — Sizes 5107 thru 5407 (SF = 1.4)

Ⓢ **Horizontal Drives** – Refer to Engineering 377-114 for maximum output speeds. **Vertical Drives** – Make selection from Table 2, Table 3 or Table 4 and then refer to Engineering 377-114 to determine drive speed limits with and without cooling.

Ⓢ Values are for V-belt drives and load applied one shaft diameter from seal cage or fan if so equipped. For minimum sheave diameters for other axial locations, refer to load location factor table on page 16. Multiply values by 0.66 when using timing belt or chain drives.

Ⓢ Minimum sheave PD is maximum for speed range. Consult Rexnord factory for lower values.

### Class III

#### Quick Selections for <sup>®</sup> Shaft (JR) and Flange (JF) Mounted Drives — Sizes 5107 thru 5608, Screw Conveyor (JSC) Drives — Sizes 5107 thru 5407 (SF = 2.0)

Table 4

Ⓛ **Horizontal Drives** – Refer to Engineering 377-114 for maximum output speeds. **Vertical Drives** – Make selection from Table 2, Table 3 or Table 4 and then refer to Engineering 377-114 to determine drive speed limits with and without cooling.  
<sup>Ⓜ</sup> Values are for V-belt drives and load applied one shaft diameter from seal cage or fan if so equipped. For minimum sheave diameters for other axial locations, refer to load location factor table on page 16. Multiply values by 0.66 when using timing belt or chain drives.  
<sup>Ⓜ</sup> Minimum sheave PD is maximum for speed range. Consult Rexnord factory for lower values.

# Engineering Data

## Overhung Load at Hollow Shaft ③

**Overhung Loads** — Overhung load is imposed upon a shaft when a pinion, sprocket or sheave is used as a power take-off. The magnitude of the load varies with the type of take-off and its proximity to the shaft bearing. Calculate the load (including minimum required service factor) and check the result against the tabulated overhung load rating. The overhung load formula below considers the transmitted horsepower without service factor. This is appropriate for applications where starting loads, momentary overloads and brake capacities do not exceed 200% of drive rating (100% overload). For other conditions, compute the equivalent power by multiplying the transmitted power by the appropriate service factor.

$$\text{Overhung Load} = \frac{126,000 \times \text{hp} \times F_c \times L_f}{\text{pitch diameter} \times \text{rpm}}$$

### F<sub>c</sub> = Load Connection Factor

Sprocket ①	1.00
Synchronous (timing) Belts.....	1.30
V-Belt.....	1.50
Machined Pinion & Gear ①.....	1.25
Flat Belt.....	2.50

### L<sub>f</sub> = Load Location Factor

Select L<sub>f</sub> from Table 6, under drive size and opposite distance from end of hollow shaft.

**Locate the centerline of the load** as close to the drive seal cage as practical to minimize the effect of the overhung load and increase bearing life.

**Consult Factory for Higher Overhung Load Ratings** — In many cases, overhung load capacity in excess of that published is available. If the actual load should exceed the published capacity, refer full details to Rexnord; provide complete application information (see page 6), as well as direction of rotation, location and direction of applied load.

**Example** — A chain drive requiring 10 hp is being driven by a 5207JF14, 100 rpm output, using a single-width, 21-tooth, 8.4" pitch diameter sprocket mounted on a low speed stub shaft. Centerline of the load is 4" from the output face of the housing.

**Procedure:** F<sub>c</sub> = 1.00      L<sub>f</sub> = 1.08

$$\text{Overhung Load} = \frac{126,000 \times 10 \times 1.00 \times 1.08}{8.4 \times 100} = 1620 \text{ lb}$$

Since the overhung load capacity shown for a 5207JF14 drive at 100 rpm is 2730 pounds, the application is satisfactory.

**Table 6 — Load Location Factor (L<sub>f</sub>) for Load Located at Dimension "X" Below**

## Driven Shaft Diameter Tolerances

Shaft diameters shall be within commercial tolerances for turned and polished round bars as shown below.

Shaft Diameter	Maximum Undersize Variation – Inches
to 1.50	0.004
over 1.50 to 2.50 incl.	0.005
over 2.50 to 4 incl.	0.006
over 4 to 6 incl.	0.007
over 6 to 8 incl.	0.008

Keys and keyways in the supporting shaft shall be in accordance with ANSI B17.1 for size, depth, offset, lead and parallelism.

- ① Refer all multiple chain sprocket and pinion mounted applications to Rexnord for deflection analysis.
- ② Distance "D" is in inches from the output face of the housing. Interpolate for L<sub>f</sub> factors at intermediate distances. For example, L<sub>f</sub> is 1.11 for Size 5307 when distance is 5.50 inches. Refer to Factory for distances greater than those shown.
- ③ For JF Flanged Mounted Drives, the TA Taper bushing, using the spanner nut, is not intended to provide the full external load capacities given in Table 7 and Table 8. Use the tapered driven shafts manufactured per Manual 377-140, or non-tapered driven shafts and bushings per Manual 377-142 (5107-5315JF) & 377-144 (5407-5608JF), or refer your application to Factory for review.
- ④ Published values of low-speed shaft overhung load are for loads applied one shaft diameter from the seal cage with a service factor of unity. Where overhung load is proportional to torque (i.e. pinion, sprocket or sheave applications) an appropriate service factor should be considered in the overhung load calculation.

5608	—	—	457.90	232.40

Table 9 — Values shown in Table 9 above are referred to the drive high-speed shaft. The WR<sup>2</sup> referred to the hollow (low-speed) shaft equals the exact total ratio squared times the H.S. shaft WR<sup>2</sup>. Refer to Factory for values of unlisted ratios and drive sizes.

Table 10 — Minimum sheave diameters listed in Table 2 & Table 3 are for V-belt drives with the load applied one shaft diameter from the seal cage or from the fan guard, if equipped with a shaft cooling fan. For minimum sheave diameters for loads applied at a greater distance, multiply the published minimum sheave diameter by the load location factor (from Table 10) for the “distance” required. When using chains or timing belts, multiply minimum sheave diameters by 0.66.

**Table 10 — H.S. Shaft Load Location Factors**

### Vertical Drives

Refer to Factory for lubrication analysis of all vertical drives exceeding ±1° from true vertical.

① Dimensions are for reference only and are subject to change without notice unless certified.

② MIN = Minimum required projection of driven shaft. MAX = Maximum projection of driven shaft which allows for use of thrust plate.

③ JR = Basic Drive + Bushing + Torque Arm

JF = Basic Drive (Bushing Optional)

JSC = Basic Drive + Seal Housing + Driveshaft

④ 0° incline down on drives with backstops in 9 or 12 o'clock mounting.

⑤ Consists of bushing, drive key, nut, retaining ring and setscrew.

⑥ Check strength of driven shaft and unfurnished key.

### Drive Mounting Positions

(Based on clock position of input shaft relative to hollow shaft.)

## Hollow Shaft Details

See Manual 377-140 for JF drive tapered driven shaft recommendations. See Manual 377-142 for JF drives using tapered bushings.

## Angular Limits for Horizontal Mounting

(All Clock Positions)

Refer to Factory for lubrication analysis of all inclined drives exceeding the maximum specified below.

Drive Size <sup>③</sup>	Part Number <sup>⑤</sup>			Exact Ratio	Max Output RPM	Wt (lb)
	W/O Backstop	With Backstop	For Backstop <sup>⑥</sup>

### Vertical Drives

Refer to Factory for lubrication analysis of all vertical drives exceeding  $\pm 1^\circ$  from true vertical.

- ① Dimensions are for reference only and are subject to change without notice unless certified.
- ② MIN = Minimum required projection of driven shaft. MAX = Maximum projection of driven shaft which allows for use of thrust plate.
- ③ JR = Drive (Includes Torque Arm).
- ④ 0° incline down on drives with backstops in 9 or 12 o'clock mounting.
- ⑤ These part numbers do not include bushing.
- ⑥ Drive modified to accept backstop, but does not include backstop.
- ⑦ Non-stock, refer to Factory.
- ⑧ Consists of bushing, drive key, nut, retaining ring and setscrew.
- ⑨ Check strength of driven shaft and unfurnished key.

③ Check torque and bending capacity of driven shaft and coupling bolt shear against load. Mechanical properties of stainless steel differ from those of carbon steel.

④ Furnished with thrust plate kit and stainless steel trough end-to-seal housing fasteners.

⑤ Refer to Manual 377-146 for details.

⑥ Kit consists of: Bushing, thrust plate, fastener, key, retaining ring and hardware.

# Nominal Sheave Ratios and V-Belts

**Sheave Ratios** — The table below lists the sheave ratios for nominal gear drive ratios and output speeds when driven by 1750 and 1170 rpm motors. If sheave ratios are required for other motor speeds, or if greater accuracy than ±3% is required for the output speed, calculate the sheave ratio with the following formula, using the exact gear ratios. Check the sheave pitch diameter against the allowable minimums in selection Table 2 and Table 3.

$$\text{Sheaved Ratio} = \frac{\text{Exact Motor Speed}}{\text{Exact Gear Drive Ratio} \times \text{Required Output Speed}}$$

**Drive Ratio Substitution** — Selections in Table 2 and Table 3 list the most economical choice of drive size and ratio for a given output speed using 1750 or 1170 rpm motors. Standard drive ratios (not drive sizes) can be substituted in recommended drives. Consult Rexnord factory.

**V-Belts** — Selections can be made from any belt manufacturer's catalog. If a Falk motor mount is used, refer to pages 52-53 for dimensions and shaft centers. When determining belt length and minimum center distance, include belt installation allowance in calculations.

**Table 10 — Nominal Sheave Ratios**

① Sheave Ratios are speed increasing combinations.

## V-Belt Guards

### Falk V-Belt Guards, Built for Maximum Safety and Serviceability

Falk V-belt guards offer more than just compliance with OSHA requirements. For one thing, they're available at a low initial cost. For another, their practical construction makes them extremely user-friendly. You can quickly install them using easy-to-mount brackets. And since these covers are easy-to-remove and lightweight, they simplify field service of belt drives.

V-belt guards are available in sizes to fit most Quadrive/V-belt combinations, or to be used with other Falk drives. They come in an expanded metal cover, with a safety-orange paint finish. Falk V-Belt Guards — easily installed, easily removed.

### Guard/Hardware Selection Procedure

- Using Table 11 and known belt drive information, determine which guards are suitable.

For overall guard dimensions, refer to Table 17.

**Table 11 — Standard V-Belt Guard Selection (in) ①**

Selection Parameter	Guard Size ③							
	14E	15E, 15F	16E, 16F	17E, 17F	18E	19E, 19F	20E, 20F	21E, 21F
Center Distance (Minimum)	21.00	22.00	27.00	29.00	34.00	34.00	32.00	42.50
Center Distance (Maximum)	28.00	29.00	34.00	36.00	42.00	42.00	42.00	56.00
Maximum Driver Shaft Diameter ②	3.50	3.50	3.50	3.50	3.50	3.50	3.50	3.50
Maximum Driven Shaft Diameter	2.00	2.25	2.25	2.25	3.00	3.00	3.00	3.00
Maximum Driver Sheave Diameter	6.50	8.00	8.00	10.00	10.00	12.00	12.00	14.00
Maximum Driven Sheave Diameter	8.00	14.00	14.00	15.00	15.00	20.00	28.00	32.00
Maximum Sheave Width	4.00	5.00	5.00	5.00	8.25	8.25	8.25	8.50

① Table allows for 3.5" of belt take-up adjustment.

② Maximum driver is a size 449T NEMA frame.

③ E = Expanded metal covers (without fans).  
F = For drives with shaft-driven fans.

- Determine availability of mounting hardware:

Is guard for use with Falk Quadrive?

Will standard Quadrive motor mount be used?

Are standard mounting brackets available (See Table 12)?

**Table 12 — Mounting Bracket Availability**

Guard Size	Drive Size

Supply guard complete with guard mounting brackets. See Table 13 for part numbers of drives w/o shaft fan. See Table 14 for part numbers of drives with shaft fan.

Option 1: Supply guard only (Table 15) with loose strapping by Rexnord (Table 16). Rexnord will provide 4 feet of 12 gauge strapping with sheet metal screws. Purchaser must cut, bend, drill and mount.

Option 2: Supply guard only (Table 15). Purchaser is responsible for all mounting.

# Motor Mount Shaft Centers & Motor Frame Sizes

## Introduction

The following supplements the data published on pages 46-53. If shaft centers exceed the published maximum, refer complete data to Factory for engineering review.

## Mounting Positions

The A3 assembly is the most common horizontal mounting position. However, the motor mount and drive may be mounted in any of the positions shown at the right. See Table 18 for center distance.

**Table 18 — Motor-Driveshaft Centers (in)**

Mounting Positions	Motor Frame Sizes	56T, 143T, 145T	182T, 184T	213T, 215T	254T, 256T	284T, 286T	324T, 326T	364T, 365T	404T, 405T	444T, 445T, 447T, 449T

## Accessories/Options

### Shim Blocks (in)

Shim Block		Part Number		
No.	Thickness	56-215T	254-365T	404-449T
X 1/2	0.5	0711640	0711645	0759948
X 1	1.0	0711643	0745025	0759949
X 1-1/2	1.5	0709360	0709361	0709363

**Shim Blocks – All Sizes** — Shim blocks are available (at no extra charge when ordered with the motor mount) to increase the shaft centers up to 1-1/2" as shown. Specify thickness required when ordering motor mount. These may be used with either the short center low bases or the long center high bases to assist in matching the shaft centers to the available V-belt centers. Please specify size shim block required; X 1/2, X 1 or X 1-1/2.

### Thrust Plate Kits for JF Drives Utilizing TA Taper Bushing ①

Drive Size	Description ②	Part No.
5107	TP5107JF	0778773
5115	TP5115JF	0778774
5203	TP5203JF	0778775
5207	TP5207JF	0778776
5215	TP5215JF	0778777
5307	TP5307JF	0778778
5315	TP5315JF	0778779
5407	TP5407JF	0778780
5415	TP5415JF	0778781
5507	TP5507JF	0778782
5608	TP5608JF	0778783

① Refer to Manual 377-142 (5107JF thru 5315JF) or 377-144 (5407JF thru 5608JF).

② Kit consists of: Thrust plate, thrust plate fastener, hollow shaft retaining ring and driveshaft retaining ring.

### TA Removal Tool

RT5107-5315J    PN 0769406    Wt. 8 lb  
(Tool with 5 adapters and case)

RT5407-5608J    PN 0769407    Wt. 10 lb  
(Tool with 2 adapters and case)

## Why Choose Rexnord?

When it comes to providing highly engineered products that improve productivity and efficiency for industrial applications worldwide, Rexnord is the most reliable in the industry. Commitment to customer satisfaction and superior value extend across every business function.

### Delivering Lowest Total Cost of Ownership

The highest quality products are designed to help prevent equipment downtime and increase productivity and dependable operation.

### Valuable Expertise

An extensive product offering is accompanied by global sales specialists, customer service and maintenance support teams, available anytime.

### Solutions to Enhance Ease of Doing Business

Commitment to operational excellence ensures the right products at the right place at the right time.

# REXNORD

## Rexnord Company Overview

Rexnord is a growth-oriented, multi-platform industrial company with leading market shares and highly trusted brands that serve a diverse array of global end markets.

## Process & Motion Control

The Rexnord Process & Motion Control platform designs, manufactures, markets and services specified, highly engineered mechanical components used within complex systems where our customers' reliability requirements and the cost of failure or downtime are extremely high.

## Water Management

The Rexnord Water Management platform designs, procures, manufactures and markets products that provide and enhance water quality, safety, flow control and conservation.
